

Six first-use routes. The HTML article carries links, examples, and complete scope boundaries.

1. Specify

State the response model, distributional parameters, and dependence structure.

Functions: `bf()`, `drm_formula()`, `meta_V()`, `miss_control()`, `phylo()`, `spatial()`, `relmat()`, `corpair()`

2. Fit

Fit the specified model with the primary fitting function.

Functions: `drmTMB()`, `drm_control()`

3. Check fit health

Check convergence, gradients, uncertainty information, boundaries, and model-specific warnings.

Functions: `check_drm()`, `is_converged()`

Interpret

Extract fixed, random, scale, and correlation quantities on named scales.

Functions: `fixef()`, `ranef()`, `structured_effects()`, `rho12()`, `corpairs()`

Predict and assess

Build prediction grids, predict parameters, and inspect fitted distribution adequacy.

Functions: `prediction_grid()`, `predict_parameters()`, `fitted_distribution()`, `exceedance()`, `centile_chart()`, `qq_plot()`

Uncertainty and simulation

Discover available targets, request target specific intervals, or simulate from a fitted model.

Functions: `profile_targets()`, `confint()`, `profile()`, `simulate()`
